

# Elements

An International Magazine of Mineralogy, Geochemistry, and Petrology

Volume 15, Number 1 • February 2019

The interior structure of Mercury. The relatively thick crust (ca. 40 km) overlies the comparatively thin mantle (ca. 400 km). A hypothetical iron sulfide layer might occur at the core-mantle boundary, overlying the liquid outer core (radius of ca. 2,000 km). The innermost part of Mercury is made of a solid core suggested to have a radius <1,000 km.

*Elements* is published jointly by the Mineralogical Society of America, the Mineralogical Society of Great Britain and Ireland, the Mineralogical Association of Canada, the Geochemical Society, the Clay Minerals Society, the European Association of Geochemistry, the International Association of GeoChemistry, the Société Française de Minéralogie et de Cristallographie, the Association of Applied Geochemists, the Deutsche Mineralogische Gesellschaft, the Società Italiana di Mineralogia e Petrologia, the International Association of Geoanalysts, the Polskie Towarzystwo Mineralogiczne (Mineralogical Society of Poland), the Sociedad Española de Mineralogia, the Swiss Society of Mineralogy and Petrology, the Meteoritical Society, and the Japan Association of Mineralogical Sciences. It is provided as a benefit to members of these societies.

*Elements* is published six times a year. Individuals are encouraged to join any one of the participating societies to receive *Elements*. Institutional subscribers to any of the following journals—*American Mineralogist*, *Clay Minerals*, *Mineralogical Magazine*, and *The Canadian Mineralogist*—also receive one copy of *Elements* as part of their 2019 subscription. Institutional subscriptions are available for US\$165 (US\$180 non-US addresses) a year in 2019. Contact the executive editor (jrosso.elements@gmail.com) for information.
